

Six Most Reported Health Conditions for Middle School Students (Data from SC Annual School Nursing Surveys)

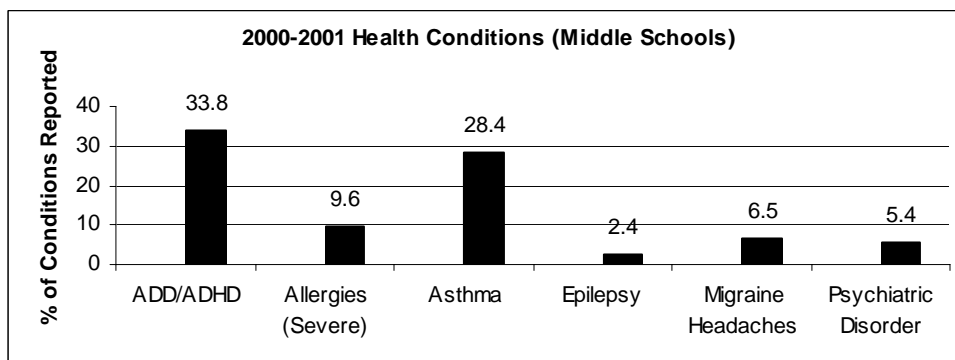

Attention deficit disorder / attention deficit disorder with hyperactivity, asthma, severe allergies, epilepsy, migraine headaches and psychiatric disorders were the six most reported health conditions for middle school students. Asthma and attention deficit disorder / attention deficit disorder with hyperactivity was slightly less reported for middle school students than for elementary school students (60% vs. 65% of the reported conditions). Middle school students were reported to have more migraine headaches and psychiatric disorders than elementary school students. The graphs below show the percentage for each of the six most reported health conditions. The percentages refer to a percentage of the total of all health conditions reported for middle school students for the school year indicated.

Survey responses received from 41 of 85 school districts.

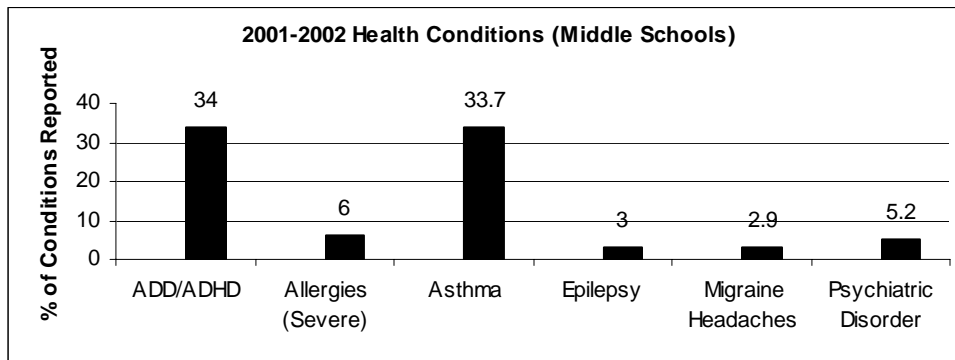

Survey responses received from 45 of 85 school districts.

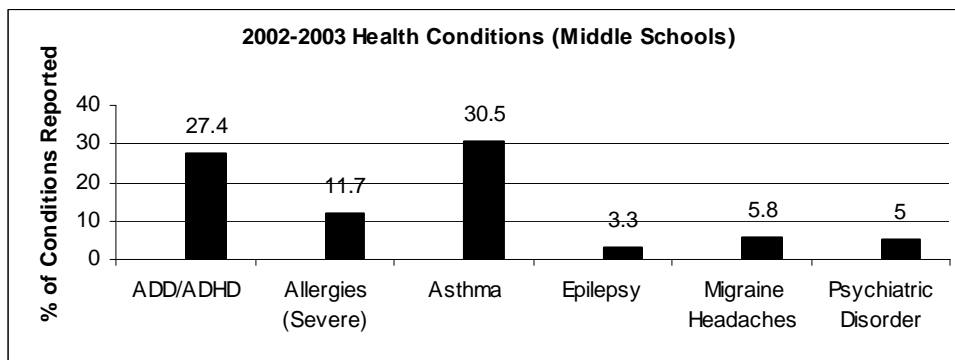

Survey responses received from 51 of 85 school districts.

Six Most Reported Health Conditions for Middle School Students (cont'd) (Data from SC Annual School Nursing Surveys)

Survey responses received from 12 of 85 school districts.

Survey responses received from 36 of 85 school districts.
